

InVision HMI™ Enhanced Operator Interface

Trident Automation is dedicated to helping you get the most value out of your control system investment. We have won national awards with our operator interface technology and InVision HMI is another step in enhancing the life cycle of your control system. InVision HMI is based on the latest version of Wonderware software operator that integrates seamlessly with your control system hardware and configuration.

The life cycle of control system hardware is much slower than PC technology. However expensive control system replacements are often required not because the control hardware is failing, but because the computers it uses for the operator interface are no longer available. InVision HMI allows the use of late model PCs in conjunction with existing DCS hardware. And because its 100% Wonderware, its open and supportable by 100's of different engineering firms.

Key Features

- Support for wide screen, dual, triple or quad monitors and high resolution graphics.
- Enhanced alarm management.
- Enhanced diagnostics and update control.
- Integrates information from the plant, lab and management for use by any plant personnel.
- Faceplate groups.
- Access via web browser.
- Powered by Wonderware 10.0 technology, the world's most popular HMI.

Benefits for your Plant

- Replace the weak point in your control system with the latest technology.
- Minimize operator re-training.
- Convert graphics at a rate of several per hour.
- Integrate data from multiple control system and lab instruments.
- Allow focused access to plant and lab data outside the control room.
- Complete the migration without affecting plant operations.
